### Perfect Remediation successfully completed a staged laboratory refurbishment project for Envirolab Services at their Sydney Head Laboratory in Chatswood, NSW

The scope included upgrading the existing operational laboratory to meet industry standards, optimising workflow, and installing new equipment from fume cabinets to mechanical services. Roof repairs, maintenance works, and installation of a new roof safety system were also carried out on the building.

Working in a busy laboratory facility required careful coordination to minimise disruptions to daily operations. The facility remained fully operational throughout the refurbishment, with strategies implemented to avoid any negative impact on ongoing activities. Long lead times for specialty chemical resistant vinyl floor finishes required upfront planning and early procurement to prevent delays.

Perfect Remediation closely managed subcontractors and suppliers to ensure the client's needs were met throughout the project. Weekly reporting kept all stakeholders informed, enabling transparency and collaborative decision making.

All three stages were completed and handed over on time, ensuring a seamless transition with no disruption to the Envirolab Services team and their operations.
